West Nile Virus Update

Three more samples of *Culex* mosquitoes have tested positive for West Nile virus (WNV). The samples were collected on August 18, 2026. So far this year in Warren County, there have been a total of eight (8) WNV positive mosquito samples; the positive mosquitoes were collected from Belvidere (2), Greenwich Township, Hackettstown, Lopatcong Township (3), and Washington Township. For West Nile virus surveillance, adult mosquitoes are collected from traps specifically designed to catch *Culex* mosquitoes, the type responsible for transmitting West Nile virus, particularly from bird to bird. Each sample contains up to 75 individual adult mosquitoes of the same species from the same location.

Warren County Mosquito Control Commission has been collecting and submitting mosquito samples for testing each week since the state laboratory began its mosquito testing for the year on May 18, 2026. Mid-to-late August is usually the peak time for humans and other mammals to acquire this virus. One person has been confirmed positive in New Jersey so far this year. Warren County Mosquito Commission staff perform larval (aquatic immature stage) mosquito control daily throughout the County. However, treatments to reduce adult mosquito populations in West Nile positive areas are weather pending. Check our website for updates.

Mosquito populations are currently very high in parts of the county due to recent rainfall events.

Residents are urged to help reduce their risk of contracting mosquito-borne diseases by following these guidelines:

- Don't produce mosquitoes on your property. **Dump** or **drain** standing water. Mosquitoes can't begin their life without water.
- **Defend** yourself against mosquitoes using repellents containing DEET, Picaridin, or Oil of Lemon Eucalyptus.
- Avoid being outdoors when mosquitoes are present, typically **Dawn** and **Dusk.**
- **Report neglected swimming pools** by calling 908-453-3585 or visiting **www.warrencountymosquito.org** *Anonymous calls accepted*. Just one neglected pool can produce more than **1 million** mosquitoes and affect people up to **five miles** away.

WEST NILE VIRUS INFORMATION

West Nile virus symptoms of the mild form include fever, headache, tiredness, body aches, and swollen lymph glands. While the illness can be as short as a few days, even healthy people have reported being sick for several weeks. There were two severe human cases of West Nile virus in Warren County in 2024.

Less than one percent of individuals (about 1 in 150 people) infected with West Nile virus will develop severe illness. The severe symptoms can include high fever, headache, neck stiffness, stupor, disorientation, coma, tremors, convulsions, muscle weakness, vision loss, numbness and paralysis. These symptoms may last several weeks, and neurological effects may be permanent. West Nile virus infection can be fatal.
